SUBWOOFER 15SWS800

SELENIUM PRO

The 15SWS800 is a high power 15" professional subwoofer specially designed to reproduce sound at the very low end of the audio spectrum.This new design is capable of handling up to 1,600 Watts Continous Music.

A bumped and undercut T-yoke assures a minimum of magnetic rectification (off centering) and acompatible maximum displacement.

The magnet assembly was designed with the assistance of a Finite Element Analysis (FEA) software in order to ensure optimization.

The 15SWS800 employs a 4" (100 mm) diameter 4-layer cooper voice coil using over 80 grams of cooper. This is wound in a fiberglass former, twice the thickness of typical formers, to drive the moving assembly with great rigidity.

A non-pressed long fiber pulp cone has the necessary stiffness to withstand the tremendous accelerating forces involved and is properly centered by two counteracting polycottonfiber spiders.

An triple cooling system consisting of a large diameter center hole surrounded by six smaller holes (directly cooling the gap) and six frame windows (cooling the air trapped between the two spiders) are responsible for an efficient heat transfer mechanism.

A highly reinforced aluminum injected frame is effective in absorbing mechanical shocks and acts as a heat sink without interfering with the magnetic field.

SPECIFICATIONS

Nominal diameter	380 (15)	mm (in)
Nominal impedance	8	
Minimum impedance @ 115 Hz	6.9	
Power handling		
Peak	3,200	W
Continuous Music[1]	1,600	W
NBR[2]	800	W
AES[3]	600	W
Sensitivity (2.83V@1m) averaged from 60 to 200 Hz	93	dB SPL
Power compression @ 0 dB (nom. power)	2.4	dB
Power compression @ -3 dB (nom. power)/2	1.8	dB
Power compression @ -10 dB (nom. power)/10	1.1	dB
Frequency response @ -10 dB	35 to 1,500	Hz

[1] Power handling specifications refer to normal speech and/or music program material, reproduced by an amplifier producing no more than 5% distortion. Power is calculated as true RMS voltage squared divided by the nominal impedance of the loudspeaker.
[2] NBR Standard (10,303 Brasilian Standard).
[3] AES Standard (60 - 600 Hz).

HOW TO CHOOSE THE RIGHT AMPLIFIER

The power amplifier must be able to supply twice the RMS driver power. This 3 dB headroom is necessary to handle the peaks that are common to musical programs. When the amplifier clips those peaks, high distortion arises and this may damage the transducer due to excessive heat. The use of compressors is a good practice to reduce music dynamics to safe levels.

FINDING VOICE COIL TEMPERATURE

It is very important to avoid maximum voice coil temperature. Since moving coil resistance (R_E) varies with temperature according to a well known law, we can calculate the temperature inside the voice coil by measuring the voice coil DC resistance:

$$T_B \quad T_A \quad \frac{R_B}{R_A} \quad 1 \quad T_A \quad 25 \quad \frac{1}{_{25}}$$

T_A , T_B= voice coil temperatures in °C.
R_A , R_B= voice coil resistances at temperatures T_A and T_B, respectively.
= voice coil wire temperature coefficient at 25 °C.

POWER COMPRESSION

Voice coil resistance rises with temperature, which leads to efficiency reduction. Therefore, if after doubling the applied electric power to the driver we get a 2 dB rise in SPL instead of the expected 3 dB, we can say that power compression equals 1 dB. An efficient cooling system to dissipate voice coil heat is very important to reduce power compression.

NON-LINEAR VOICE COIL PARAMETERS

Due to its close coupling with the magnetic assembly, the voice coil in electrodynamic loudspeakers is a very non-linear circuit. Using the non-linear modeling parameters Krm, Kxm, Erm and Exm from an empirical model, we can calculate voice coil impedance with good accuracy.
